Energy Crops Nigel G. Halford, Angela Karp, 2011 The last few years have seen the concept of bioenergy and biofuels come of age Rising oil prices have led to more food crops being grown for energy as well as food This has created controversy by adding to the upward pressure on crop commodity prices that was already being created by the increasing demand for food from an expanding population More attention has therefore focussed on meeting the rising demand for bioenergy and biofuels in more sustainable ways A wider range of crops is being explored including non food crops as well as the use of crop residues rather than grain or seed *Energy Crops* is a comprehensive reference source which looks at this topic from the plant and agricultural science perspective It covers energy crops that are already in use and those that are being developed or researched Species that have been cultivated by humankind for millennia and some that have never been considered as crops before fall within its coverage The introductory chapter defines energy crops before reviewing the development and current state of the technology It also gives an historical perspective and introduces the ethical issues Each of the subsequent chapters is dedicated to a single crop and describes the current usage of that crop for energy its potential for future development the economics of its use for energy production and the research that is being undertaken to tailor it for use as an energy crop Where appropriate the implications for food and feed security are balanced against the benefits in terms of fuel security the impending oil supply peak the need to reduce CO<sub>2</sub> emissions and the implications for climate change mitigation Each chapter is written by a specialist author or authors of international standing The chapters by representatives of the plant breeding and biofuel industries give an industrial perspective on why energy crops have come of age They also describe how the sector is expected to develop with a wish list of crop improvements that industry would like to see realized These include higher levels of fermentable starch cellulose fibres and oil quality through to the production of pure hydrocarbons The book is suitable for undergraduates postgraduates academics and those working in industry

**Chemical and Biochemical Catalysis for Next Generation Biofuels** Blake A. Simmons, 2011 The development of renewable and sustainable lignocellulosic biofuels is currently receiving worldwide attention and investment Despite decades of research there remain significant challenges to be overcome before these biofuels can be produced in large volumes at competitive prices One obstacle is the lack of efficient and affordable catalytic systems to dissolve and hydrolyze polysaccharides into sugars These sugars are then fed to microorganisms and fermented into biofuels The price of these catalysts be they biological thermochemical or chemical in nature represent one of the largest costs in the conversion process There are a number of catalytic schemes each with their own advantages and disadvantages available This book presents a general yet substantial review of the most promising processes and the spectrum of biomass pretreatment enzymes chemical catalysts and hybrid approaches of hydrolyzing biomass into fermentable sugars It is the only currently available book that compares the biochemical chemical and thermochemical conversion processes to biofuel production
