

AUDACIOUS EYE-SPOTS (LEPIDOPTERA)

While many butterflies and moths depend on camouflage to stay safe, many species have evolved complicated eyespots that are celebrated and admired by human cultures all over the world. Scientists are still investigating what these eyespots do. In some cases, the eyespots may scare a predator into thinking a bigger animal is looking back at them.

IO MOTH

Automeris io

When resting under side of a tree, the io moth looks to resemble web in that gray drabbing. Should a predator approach, the io moth opens up its wings quickly to reveal a pair of shockingly large eyespots that shock the predator and scare it away.

Like its close relative, the white of the moth appears black from their paper without camouflage and do not feed as adults. All of the energy the io moth feeds up is to build silk, a cocoon, during the caterpillar life stage.

Scientists have noted how great these eyespots are for scaring predators away and concluded that the distance is closer than against small birds. The European peacock has another defense for longer eyes and since it predators are mistaking for like a snake.

The comet moth's unusual spread patterns are usually used to scare off birds and insects that detect it during the day while it rests. At night, when the comet moth flies, it leaves a different pattern – bats.

Researchers do not think eyespots have between these predators from night when there is less light. To stop this predator from attacking, the comet moth has evolved a different adaptation.
