Energy Perspectives Problems And Prospects:

Energy Michael B. McElroy, 2010 How the world evolved to its present dependence on carbon based fossil fuels the problems that ensued including the threat of disruptive global climate change and hazards associated with our increasing dependence on unreliable but currently indispensable sources of energy such as oil and the opportunities for a more sustainable energy future *Energy* , The book offers a comprehensive account of how the world evolved to its present state in which humans now exercise a powerful in many cases dominant influence for global environmental change It outlines the history that led to this position of dominance in particular the role played by our increasing reliance on fossil sources of energy on coal oil and natural gas and the problems that we are now forced to confront as a result of this history The concentration of carbon dioxide in the atmosphere is greater now than at any time over at least the past 650 000 years with prospects to increase over the next few decades to levels not seen since dinosaurs roamed the Earth 65 million years ago Comparable changes are evident also for methane and nitrous oxide and for a variety of other constituents of the atmosphere including species such as the ozone depleting chlorofluorocarbons for which there are no natural analogues Increases in the concentrations of so called greenhouse gases in the atmosphere are responsible for important changes in global and regional climate with consequences for the future of global society which though difficult to predict in detail are potentially catastrophic for a world poorly equipped to cope Changes of climate in the past were repetitively responsible for the demise of important civilizations These changes however were generally natural in origin in contrast to the changes now underway for which humans are directly responsible The challenge is to transition to a new energy economy in which fossil fuels will play a much smaller role We need as a matter of urgency to cut back on emissions of climate altering gases such as carbon dioxide while at the same time reducing our dependence on unreliable potentially disruptive though currently indispensable sources of energy such as oil the lifeblood of the global transportation system The book concludes with a discussion of options for a more sustainable energy future highlighting the potential for contributions from wind sun biomass geothermal and nuclear supplanting currently unsustainable reliance on coal oil and natural gas **Energy for Sustainable Society** Oguz A. Special strategic analyses cover: What unlocking the purely economic potential for energy efficiency could do, country by country and sector by sector for oil markets, the climate and the economy. The Iraqi energy sector, examining both its importance in satisfying the country's own needs and its crucial role in meeting global oil and gas demand. The water-energy nexus as water resources become increasingly stressed and access more contentious. Measures of progress towards providing universal access to modern energy services.
