Interactive Computer Modeling of Energy Use in Building Design Carl Hugo Olsson, 1989 *Energy Modeling in Architectural Design* Timothy Hemsath, Kaveh Alagheh Bandhosseini, 2017-07-06

Energy Modeling in Architectural Design demonstrates how design elements can lead to energy savings to help you reduce the energy footprint of your buildings. In addition to identifying climate opportunities you will also learn fundamental passive design elements for software agnostic energy modeling of your projects from conception. Using parametric models and testing each element during design will lead you to create beautiful and high performance buildings. Illustrated with more than 100 color images, this book also includes a pattern guide for high performance buildings, discusses energy and daylighting optimization and has a glossary for easy reference.

Procedures for Automated Building Energy Model Production for Urban and Early Design Timur Dogan, 2015. This research is meant to facilitate a wider use of energy simulation in urban and schematic building design. The major contribution is the development and validation of software algorithms that can manage automatically produce and execute building energy models for urban and schematic design. Modeling approaches for building performance simulation engines such as EnergyPlus and TRNSYS have been developed. The first approach introduces an algorithm that automatically converts arbitrary building massing models into multi zone thermal models following the ASHRAE 90.1 Appendix G prescribed perimeter and core discretization schema. This method yields geometrically resolved multizone models and provides a streamlined workflow for single and multi building energy evaluation. The second approach dissects an urban massing model that may consist of hundreds of buildings with various architectural programs into a discrete number of typical room energy models. It is shown that for standard interior partitions and fully conditioned spaces the method yields results that are comparable to conventional perimeter and core simulations in terms of accuracy as well as temporal and spatial resolution at a fraction of the calculation time. This speed up facilitates interactive urban level design evaluations. The third approach explores the energetic consequences of using a zoning methodology that goes beyond generic perimeter and core subdivisions. Based on a review and categorization of real floor plan designs, it is shown that key characteristics of interior subdivisions have a decisive effect on building energy use and present a largely untapped opportunity for architects to reduce building energy use in schematic design. Each approach is documented and simulation

results are compared against conventional modeling workflows for a realworld urban case study As a proof of concept the mentioned methods have been implemented as plug ins for the widely used CAD modeling software Rhinoceros3d Rhino and its parametric scripting environment Grasshopper The MIT Design Advisor Bryan James Urban,2007 Simulation tools when applied early in the design process can considerably reduce the energy demand of newly constructed buildings For a simulation tool to assist with design it must be easy to use provide feedback quickly and allow rapid comparisons Most existing tools do not meet these needs usually because they were intended for modeling finalized building designs Often there is no user interface and it can take hours or days to prepare run and interpret results Such tools are too sophisticated for design purposes In this document the MIT Design Advisor is presented as a simple and rapid building energy simulation tool developed specifically for architects and building designers Conceptual building designs can be modeled quickly and without formal training Results are interpreted graphically and displayed to the user in a simple user interface Side by side comparisons of building designs can be made allowing users to quickly learn which building components have the biggest impact on energy consumption heating cooling and lighting indoor daylight levels and thermal comfort User specified building parameters are used together with local weather data to predict monthly and annual energy use The heat transfer model used to make the energy predictions is explained in detail in this thesis Calculation methods are given and validated Agreement with existing models is quite good The MIT Design Advisor is available at <http://designadvisor.mit.edu>
