Famine Early Warning Systems And Remote Sensing Data:

Famine Early Warning Systems and Remote Sensing Data Molly E. Brown, 2008-05-06 This book describes the interdisciplinary work of USAID's Famine Early Warning System Network FEWS NET and its influence on how food security crises are identified, documented, and the kind of responses that result. The book describes FEWS NET's systems and methods for using satellite remote sensing to identify and describe how biophysical hazards impact the lives and livelihoods of the population where they occur. It presents several illustrative case studies that will demonstrate the integration of both physical and social science disciplines in its work. FEWS NET's operational needs have driven science in biophysical remote sensing applications through its collaboration with the US Geological Survey, the National Aeronautics and Space Administration, National Oceanographic and Atmospheric Administration, and US Department of Agriculture, as well as methodologies in the social science domain through its support of the US Agency for International Development, UN World Food Program, and numerous international non-governmental organizations such as Save the Children, Oxfam, and others. Because FEWS NET is an organization that must provide a global picture of food insecurity to decision makers, the information it relies on are by necessity servable and able to be documented. Thus many aspects of traditional livelihood analysis, for example, cannot be used by FEWS NET as they rely upon relationships and ways of expressing power and knowledge at the local scale that cannot be easily scaled up to express variations in access to food at a community level.

Geospatial Techniques in Urban Hazard and Disaster Analysis Pamela S. Showalter, Yongmei Lu, 2009-11-11 This book is the second in a series that examines how geographic information technologies (GIT) are being implemented to improve our understanding of a variety of hazard and disaster situations. The main types of technologies covered under the umbrella of GIT as used in this volume are geographic information systems, remote sensing (not including ground penetrating or underwater systems), and global positioning systems. Our focus is on urban areas broadly defined in order to encompass rapidly growing and densely populated areas that may not be considered urban in the conventional sense. The material presented here is also unabashedly applied; our goal is to provide GIT tools to those seeking more efficient ways to respond to, recover from, mitigate, prevent, and/or model hazard and disaster events in urban settings. Therefore, this book was created not only with our colleagues in the academic world in mind, but also for hazards professionals and practitioners. We also believe graduate students will find the material presented here of interest, as may upper division undergraduate students.

The SAGE Handbook of Remote Sensing Timothy A. Warner, M. Duane Nellis, Giles M. Foody, 2009-06-18 A magnificent achievement! A who's who of contemporary remote sensing have produced an engaging, wide-ranging, and scholarly review of the field in just one volume. Professor Paul Curran, Vice-Chancellor, Bournemouth University, Remote Sensing acquires and interprets small or large scale data about the Earth from a distance. Using a wide range of spatial, spectral, temporal, and radiometric scales, Remote Sensing is a large and diverse field for which this Handbook will be the key research reference. Organized in four key sections: Interactions of

Reso *Geospatial Technology for Natural Resource Management* Shruti Kanga,Gowhar Meraj,Suraj Kumar Singh,Majid Farooq,M. S. Nathawat,2024-10-18 This book is essential for anyone interested in understanding and implementing sustainable resource development strategies as it covers the crucial first stage of assessing resource availability and condition along with the use of modern geospatial technologies such as remote sensing GIS and GPS for surveying mapping and monitoring various resources for global environmental protection and sustainable development The first step in developing a sustainable resource strategy is assessing the availability and condition of resources This involves evaluating baseline levels identifying trends and understanding their consequences Mitigation policies are then developed based on this assessment Modern geospatial technologies like Remote Sensing RS Geographic Information Systems GIS and Global Positioning Systems GPS offer powerful tools for surveying mapping and monitoring both renewable and nonrenewable resources These technologies support global environmental protection disaster management and sustainable development by providing repetitive and global data GPS provides accurate geographic coordinates while GIS allows visualization analysis and decision making through spatial data enabling the study of complex environmental and natural resource challenges at various scales *Food Security Tipping Points: Using Remote Sensing to Improve Famine Early Warning Systems* Prasanna Krishna Krishnamurthy Reddiar,2020 With a growing population and climate related disasters projected to become more severe the need to anticipate and better prepare for food crises has never been higher Status quo early warning systems perform well by and large but complex weather phenomena are a major source of uncertainty In this dissertation I explore whether statistical diagnostics associated with tipping point theory can be used to improve detection of major crises First the accuracy of early warning systems is evaluated with a focus on the Greater Horn of Africa I discuss geographical disparities in early warning skill and explore the various sources of uncertainty that impact food security projection accuracy I quantify the contribution of climate forecast skill and conflict events in overall early warning skill to use as a baseline upon which to improve Second the potential applications of tipping point theory are discussed in relation to the use of remotely sensed environmental variables for food security early warning I evaluate the different statistical diagnostics that can be applied to identify food security tipping points and the data requirements in terms of spatial and temporal resolutions data availability latency and geographic coverage in order to be maximally useful for early warning analysis Finally I test whether statistical diagnostics of tipping points can be used for detection of food security transitions Through this work I demonstrate the utility of combining soil moisture measurements from the SMAP mission with food price data for identifying transitions with a lead time of approximately 3 months The model presented here was used to detect all major food security transitions both towards and away from a crisis in the observational record of soil moisture Importantly the diagnostics are also correlated with the magnitude of change in food security conditions which is critical information for food security planning Overall the dissertation advances the science and capabilities of food security early warning which will lead to an improvement in saving
