How is genetic information stored and copied?

## Why?

Deoxyribonucleic acid or **DNA** is the molecule of heredity. It contains the genetic blueprint for life. For organisms to grow and repair damaged cells, each cell must be capable of accurately copying itself. So how does the structure of DNA allow it to copy itself so accurately?

DNA replication the process of copying one double stranded DNA molecule to form two identical copies is highly conserved at the mechanistic level across evolution Interesting in its own right as a fascinating feat of biochemical regulation and coordination DNA replication is at the heart of modern advances in molecular biology An understanding of the process at both the biological and chemical level is essential to developing new techniques in molecular biology Insights into the process at the molecular level provide opportunities to modulate and intervene in replication Rapidly dividing cells need to replicate their DNA prior to division and targeting components of the replication process is a potentially powerful strategy in cancer treatment

Conversely ageing may be associated with loss of replication activity and restoring it to cells may moderate some of the diseases associated with old age Replication is therefore fundamental to a huge range of molecular biological and biochemical applications and provides many potential targets for drug design The fast pace of replication research particularly in providing new structural insights has outdated the majority of available texts This learned yet accessible book contains the latest research written by those conducting it It examines conserved themes providing a biological background for biochemical chemical and pharmaceutical studies of this huge and exciting field Rather than simply itemising the replication steps and the proteins involved replication is tackled from a novel perspective The book provides logical groupings of processes based upon biochemical similarities The emphasis on mechanisms and the relationship between structure and function targets the chapters towards biochemists and biological chemists as well as molecular and cell biologists The book highlights new insights into the replication process from the assembly of pre replication complexes through polymerisation mechanisms to considering replication in the context of chromatin and chromosomes It also covers mitochondrial DNA replication and includes archaeal paradigms which are proving increasingly relevant to the study of replication in higher eukaryotes Exciting potential drug targets in DNA replication are discussed particularly in the context of treating malaria and cancer

*mechanistic studies of DNA replication and genetic recombination* Bruce Alberts, 2012-12-02 Mechanistic Studies of DNA Replication and Genetic Recombination emerged from a symposium on DNA replication and genetic recombination held from March 16-21 1980 in Keystone Colorado The event featured 30 plenary session talks 13 workshop discussion groups and the 210 poster sessions The studies described in this book are paving the way for the elucidation of other basic genetic mechanisms including new areas in molecular genetics such as those of eukaryotic gene expression and the transposition of mobile genetic elements This book is divided into 10 parts summaries of workshop discussion groups Part I studies on eukaryotic model systems for DNA replication Part II studies on bacterial replication origins Part III studies on replication origins of bacterial phages and plasmids Part IV studies on eukaryotic replication origins Part V studies on prokaryotic replication enzymology Part VI studies on eukaryotic replication enzymology Part VII studies on the fidelity of DNA replication Part VIII studies on DNA topoisomerases Part IX and studies of genetic recombination mechanisms Part X
