

Speech Coding

Speech coders have assumed considerable importance in communication systems as their performance, to a large extent, determines the quality of the recovered speech and the capacity of the system. In mobile communication systems, bandwidth is a precious commodity, and service providers are continuously met with the challenge of accommodating more users within a limited allocated bandwidth. Low bit-rate speech coding offers a way to meet this challenge. The lower the bit rate at which the coder can deliver toll-quality speech, the more speech channels can be compressed within a given bandwidth. For this reason, manufacturers and service providers are continuously in search of speech coders that will provide toll quality speech at lower bit rates.

7.1 Introduction

In mobile communication systems, the design and subjective test of speech coders has been extremely difficult. Without low data rate speech coding, digital modulation schemes offer little in the way of spectral efficiency for voice traffic. To make speech coding practical, implementations must consume little power and provide tolerable, if not excellent speech quality.

The goal of all speech coding systems is to transmit speech with the highest possible quality using the least possible channel capacity. This has to be accomplished while maintaining certain required levels of complexity of implementation and communication delay. In general, there is a positive correlation between coder bit-rate efficiency and the algorithmic complexity required to achieve it. The more complex an algorithm is, the more its processing delay and cost of implementation. A balance needs to be struck between these conflicting factors,

Document And Image Compression Signal Processing And Communications:

Document and Image Compression Mauro Barni, 2018-10-08 Although it is true that image compression research is a mature field continued improvements in computing power and image representation tools keep the field spry. Faster processors enable previously intractable compression algorithms and schemes and certainly the demand for highly portable high quality images will not abate. *Document and Image Compression* highlights the current state of the field along with the most probable and promising future research directions for image coding. Organized into three broad sections the book examines the currently available techniques, future directions and techniques for specific classes of images. It begins with an introduction to multiresolution image representation, advanced coding and modeling techniques and the basics of perceptual image coding. This leads to discussions of the JPEG 2000 and JPEG LS standards, lossless coding and fractal image compression. New directions are highlighted that involve image coding and representation paradigms beyond the wavelet based framework: the use of redundant dictionaries, the distributed source coding paradigm and novel data hiding techniques. The book concludes with techniques developed for classes of images where the general purpose algorithms fail, such as for binary images and shapes, compound documents, remote sensing images, medical images and VLSI layout image data. Contributed by international experts, *Document and Image Compression* gathers the latest and most important developments in image coding into a single convenient and authoritative source.

Signal Processing, Telecommunication and Embedded Systems: Automation and Sustainability Applications Vikrant Bhateja, Wendy Flores-Fuentes, Anagha Bhattacharya, P. Satish Rama Chowdary, 2025-11-01 The book discusses the latest developments and outlines future trends in the fields of microelectronics, electromagnetics and telecommunication. It contains original research works presented at the International Conference on Microelectronics, Electromagnetics and Telecommunication (ICMEET 2024) organized by Department of Electronics and Communication Engineering, National Institute of Technology Mizoram, India, during 19-20 December 2024. The book is divided into four volumes and it covers papers written by scientists, research scholars and practitioners from leading universities, engineering colleges and R & D institutes from all over the world and shares the latest breakthroughs in and promising solutions to the most important issues facing today's society.

Quality Assessment of Visual Content Ke Gu, Hongyan Liu, Chengxu Zhou, 2022-10-19 This book provides readers with a comprehensive review of image quality assessment technology, particularly applications on screen content images, 3D synthesized images, sonar images, enhanced images, light field images, VR images and super resolution images. It covers topics containing structural variation analysis, sparse reference information, multiscale natural scene statistical analysis, task and visual perception, contour degradation measurement, spatial angular measurement, local and global assessment metrics and more. All of the image quality assessment algorithms of this book have a high efficiency with better performance compared to other image quality

assessment algorithms and the performance of these approaches mentioned above can be demonstrated by the results of experiments on real world images On the basis of this those interested in relevant fields can use the results obtained through these quality assessment algorithms for further image processing The goal of this book is to facilitate the use of these image quality assessment algorithms by engineers and scientists from various disciplines such as optics electronics math photography techniques and computation techniques The book can serve as a reference for graduate students who are interested in image quality assessment techniques for front line researchers practicing these methods and for domain experts working in this area or conducting related application development
