Best Care Practices in Anesthesiology Pankaj Sarin (M.D.),Harvard University--MIT Division of Health Sciences and Technology,2007 Recently hospitals regulatory agencies and insurers have renewed their focus on improving patient care and safety Outcomes based measures are being utilized and hospitals are being asked to report on whether patients are being treated according to a standard of care or a best practice guideline As peri operative physicians anesthesiologists are able to evaluate and to a great degree affect the pre operative intra operative and post operative course of a patient However several barriers exist Although best practice guidelines exist current models to risk stratify patients need improvement Individual anesthesiologists currently have no uniform way to measure patient outcomes either in an institutional or provider specific manner and many treat patients based on anecdotal experience rather than on evidence based medicine We addressed these issues through development of an electronic feedback system The demonstration system targeted the problem of postoperative nausea and vomiting PONV in the ambulatory surgery patient population Because performance of existing PONV risk prediction models was poor and could not be used for educational purposes we created a new PONV risk prediction model and compared it against existing models The new improved risk prediction model was incorporated into an electronic system that gathered patient outcomes data related to best care practice and then fed back the information to care providers After implementation of the electronic feedback system we evaluated its efficacy in improving compliance with best care practices
