Abu-Mostafa, 2000 This book covers the techniques of data mining knowledge discovery genetic algorithms neural networks bootstrapping machine learning and Monte Carlo simulation Computational finance an exciting new cross disciplinary research area draws extensively on the tools and techniques of computer science statistics information systems and financial economics This book covers the techniques of data mining knowledge discovery genetic algorithms neural networks bootstrapping machine learning and Monte Carlo simulation These methods are applied to a wide range of problems in finance including risk management asset allocation style analysis dynamic trading and hedging forecasting and option pricing The book is based on the sixth annual international conference Computational Finance 1999 held at New York University's Stern School of Business

Natural Computing in Computational Finance Anthony Brabazon, Michael O'Neill, 2008-05-26 Natural Computing in Computational Finance is an innovative volume containing fifteen chapters which illustrate cutting edge applications of natural computing or agent based modeling in modern computational finance Following an introductory chapter the book is organized into three sections The first section deals with optimization applications of natural computing demonstrating the application of a broad range of algorithms including genetic algorithms differential evolution evolution strategies quantum inspired evolutionary algorithms and bacterial foraging algorithms to multiple financial applications including portfolio optimization fund allocation and asset pricing The second section explores the use of natural computing methodologies such as genetic programming neural network hybrids and fuzzy evolutionary hybrids for model induction in order to construct market trading credit scoring and market prediction systems The final section illustrates a range of agent based applications including the modeling of payment card and financial markets Each chapter

provides an introduction to the relevant natural computing methodology as well as providing a clear description of the financial application addressed. The book was written to be accessible to a wide audience and should be of interest to practitioners, academics and students in the fields of both natural computing and finance.

Evolutionary Computation in Economics and Finance Shu-Heng Chen, 2013-11-11 After a decade's development, evolutionary computation (EC) proves to be a powerful tool kit for economic analysis. While the demand for this equipment is increasing, there is no volume exclusively written for economists. This volume, for the first time, helps economists to get a quick grasp on how EC may support their research. A comprehensive coverage of the subject is given that includes the following three areas: game theory, agent-based economic modelling, and financial engineering. Twenty leading scholars from each of these areas contribute a chapter to the volume. The reader will find himself treading the path of the history of this research area from the fledgling stage to the burgeoning era. The results on games, labour markets, pollution control, institution, and productivity, financial markets, trading systems, design, and derivative pricing are new and interesting for different target groups. The book also includes information on web sites, conferences, and computer software.

Genetic Programming, 2003 Genetic Algorithms and Applications for Stock Trading Optimization Kapoor, Vivek, Dey, Shubhamoy, 2021-06-25 Genetic algorithms (GAs) are based on Darwin's theory of natural selection and survival of the fittest. They are designed to competently look for solutions to big and multifaceted problems. Genetic algorithms are wide groups of interrelated events with divided steps. Each step has dissimilarities which leads to a broad range of connected actions. Genetic algorithms are used to improve trading systems such as to optimize a trading rule or parameters of a predefined multiple indicator market trading system. Genetic Algorithms and Applications for Stock Trading Optimization is a complete reference source to genetic algorithms that explains how they might be used to find trading strategies as well as their use in search and optimization. It covers the functions of genetic algorithms, internal computer implementation of pseudo code of genetic algorithms in C, technical analysis for stock market forecasting, and research outcomes that apply in the stock trading system. This book is ideal for computer scientists, IT specialists, data scientists, managers, executives, professionals, academicians, researchers, graduate level programs, research programs, and post graduate students of engineering and science.

Natural Computing in Computational Finance Anthony Brabazon, Michael O'Neill, Dietmar Maringer, 2011-09-10 This book follows on from *Natural Computing in Computational Finance Volumes I, II, and III*. As in the previous volumes of this series, the book consists of a series of chapters, each of which was selected following a rigorous peer-reviewed selection process. The chapters illustrate the application of a range of cutting-edge natural computing and agent-based methodologies in computational finance and economics. The applications explored include option model calibration, financial trend reversal detection, enhanced indexation, algorithmic trading, corporate payout determination, and agent-based modeling of liquidity costs and trade strategy adaptation. While describing cutting-edge applications, the chapters are written so that they are accessible to a wide audience. Hence, they

should be of interest to academics students and practitioners in the fields of computational finance and economics which was selected following a rigorous peer reviewed selection process The chapters illustrate the application of a range of cutting edge natural computing and agent based methodologies in computational finance and economics The applications explored include option model calibration financial trend reversal detection enhanced indexation algorithmic trading corporate payout determination and agent based modeling of liquidity costs and trade strategy adaptation While describing cutting edge applications the chapters are written so that they are accessible to a wide audience Hence they should be of interest to academics students and practitioners in the fields of computational finance and economics The applications explored include option model calibration financial trend reversal detection enhanced indexation algorithmic trading corporate payout determination and agent based modeling of liquidity costs and trade strategy adaptation While describing cutting edge applications the chapters are written so that they are accessible to a wide audience Hence they should be of interest to academics students and practitioners in the fields of computational finance and economics written so that they are accessible to a wide audience Hence they should be of interest to academics students and practitioners in the fields of computational finance and economics

Parallel Genetic Algorithms for Financial Pattern Discovery Using GPUs João Baúto, Rui Neves, Nuno Horta, 2018-02-03 This Brief presents a study of SAX GA an algorithm to optimize market trading strategies to understand how the sequential implementation of SAX GA and genetic operators work to optimize possible solutions This study is later used as the baseline for the development of parallel techniques capable of exploring the identified points of parallelism that simply focus on accelerating the heavy duty fitness function to a full GPU accelerated GA

Biologically Inspired Algorithms for Financial Modelling Anthony Brabazon, Michael O'Neill, 2006-03-28 Predicting the future for financial gain is a difficult sometimes profitable activity The focus of this book is the application of biologically inspired algorithms BIAs to financial modelling In a detailed introduction the authors explain computer trading on financial markets and the difficulties faced in financial market modelling Then Part I provides a thorough guide to the various bioinspired methodologies neural networks evolutionary computing particularly genetic algorithms and grammatical evolution particle swarm and ant colony optimization and immune systems Part II brings the reader through the development of market trading systems Finally Part III examines real world case studies where BIA methodologies are employed to construct trading systems in equity and foreign exchange markets and for the prediction of corporate bond ratings and corporate failures The book was written for those in the finance community who want to apply BIAs in financial modelling and for computer scientists who want an introduction to this growing application domain

Natural Computing in Computational Finance Anthony Brabazon, Michael O'Neill, 2009-01-30 Recent years have seen the widespread application of Natural Computing algorithms broadly defined in this context as computer algorithms whose design draws inspiration from phenomena in the natural world for the purposes of financial modelling and optimisation A related stream of work has also

seen the application of learning mechanisms drawn from Natural Computing algorithms for the purposes of agent based modelling in finance and economics In this book we have collected a series of chapters which illustrate these two faces of Natural Computing The first part of the book illustrates how algorithms inspired by the natural world can be used as problem solvers to uncover and optimise financial models The second part of the book examines a number agent based simulations of financial systems This book follows on from Natural Computing in Computational Finance Volume 100 in Springer s Studies in Computational Intelligence series which in turn arose from the success of EvoFIN 2007 the very first European Workshop on Evolutionary Computation in Finance Economics held in Valencia Spain in April 2007 **Data Mining V A.**
