**The Methodology of Plant Genetic Manipulation: Criteria for Decision Making** Alan C. Cassells,Peter Jones,2012-12-06 A range of novel techniques is available to the plant breeder today to complement classical

breeding methods The new options are based on the integration of advances in plant cell biology with those in plant molecular biology Plant cell tissue and organ cultures provide efficient systems for transformation for the achievement of wide crosses and for the production of variation through spontaneous and induced mutation while permitting effective isolation of desired genotypes by in vitro selection This book presents a critical appraisal of the methodologies of plant genetic manipulation for advanced undergraduates postgraduates researchers and plant breeders and provides guidance on the choice of breeding options The latter depends on the breeding system of the crop the breeding objective and the tissue culture systems applicable to the target genotype s

Genetics and Genomics of the Brassicaceae Renate Schmidt, Ian Bancroft, 2010-12-03 The Genetics and Genomics of the Brassicaceae provides a review of this important family commonly termed the mustard family or Cruciferae The family contains several cultivated species including radish rocket watercress wasabi and horseradish in addition to the vegetable and oil crops of the Brassica genus There are numerous further species with great potential for exploitation in 21st century agriculture particularly as sources of bioactive chemicals These opportunities are reviewed in the context of the Brassicaceae in agriculture More detailed descriptions are provided of the genetics of the cultivated Brassica crops including both the species producing most of the brassica vegetable crops *B. rapa* and *B. oleracea* and the principal species producing oilseed crops *B. napus* and *B. juncea* The Brassicaceae also include important model plant species Most prominent is *Arabidopsis thaliana* the first plant species to have its genome sequenced Natural genetic variation is reviewed for *A. thaliana* as are the genetics of the closely related *A. lyrata* and of the genus *Capsella* Self incompatibility is widespread in the Brassicaceae and this subject is reviewed Interest arising from both the commercial value of crop species of the Brassicaceae and the importance of *Arabidopsis thaliana* as a model species has led to the development of numerous resources to support research These are reviewed including germplasm and genomic library resources and resources for reverse genetics metabolomics bioinformatics and transformation Molecular studies of the genomes of species of the Brassicaceae revealed extensive genome duplication indicative of multiple polyploidy events during evolution In some species such as *Brassica napus* there is evidence of multiple rounds of polyploidy during its relatively recent evolution thus the Brassicaceae represent an excellent model system for the study of the impacts of polyploidy and the subsequent process of diploidisation whereby the genome stabilises Sequence level characterization of the genomes of *Arabidopsis thaliana* and *Brassica rapa* are presented along with summaries of comparative studies conducted at both linkage map and sequence level and analysis of the structural and functional evolution of resynthesised polyploids along with a description of the phylogeny and karyotype evolution of the Brassicaceae Finally some perspectives of the editors are presented These focus upon the Brassicaceae species as models for studying genome evolution following polyploidy the impact of advances in genome sequencing technology prospects for future transcriptome analysis and upcoming model systems

Iqbal Qureshi, Zahoor Ahmad Dar, Shabir Hussain Wani, 2019-02-15 Development of superior crops that have consistent performance in quality and in quantity has not received the same emphasis in the field of genetics and breeding as merited Specialty trait requires special focus to propagate Yet basic germplasm and breeding methodologies optimized to improve crops are often applied in the development of improved specialty types However because of the standards required for specialty traits methods of development and improvement are usually more complex than those for common commodity crops The same standards of performance are desired but the genetics of the specialty traits often impose breeding criteria distinct from those of non specialty possessing crops Specifically quality improvement programs have unique characteristics that require careful handling and monitoring during their development for specific needs Adding value either via alternative products from the large volumes of grain produced or development of specialty types is of interest to producers and processors This work assimilates the most topical results about quality improvement with contemporary plant breeding approaches The objective of this book is to provide a summary of the germplasm methods of development and specific problems involved for quality breeding In total fourteen chapters written by leading scientists involved in crop improvement research provide comprehensive coverage of the major factors impacting specialty crop improvement **Omics in Horticultural Crops** Gyana Ranjan Rout, K.V.
