**Transfer Cells** David McCurdy, Gregorio Hueros, 2015-05-18 Transfer cells are anatomically specialized cells optimized to support high levels of nutrient transport in plants. These cells trans differentiate from existing cell types by developing extensive and localized wall ingrowth labyrinths to amplify plasma membrane surface area which in turn supports high densities of membrane transporters. Unsurprisingly therefore transfer cells are found at key anatomical sites for nutrient acquisition distribution and exchange. Transfer cells are involved in delivery of nutrients between generations and in the development of reproductive organs and also facilitate the exchange of nutrients that characterize symbiotic associations. Transfer cells occur across all taxonomic groups in higher plants and also in algae and fungi. Deposition of wall ingrowth like structures are also seen in syncytia and giant cells which function as feeding sites for cyst and root knot nematodes respectively following their infection of roots. Consequently the formation of highly localized wall ingrowth structures in diverse cell types appears to be an ancient anatomical adaption to facilitate enhanced rates of apoplastic transport of nutrients in plants. In some systems a role for transfer cells in the formation of an anti pathogen protective barrier at these symplastic discontinuities has been inferred. Remarkably the extent of cell wall ingrowth development at a particular site can show high plasticity suggesting that transfer cell differentiation might be a dynamic process adapted to the transport requirements of each physiological condition. Recent studies exploiting different experimental systems to investigate transfer cell biology have identified signaling pathways inducing transfer cell development and genes gene networks that define transfer cell identity and or are involved in building the wall ingrowth labyrinths themselves. Further studies have defined the structure and composition of wall ingrowths in different systems leading in many instances to the conclusion that this process may involve previously uncharacterized mechanisms for localized wall deposition in plants. Since transfer cells play important roles in plant development and productivity the latter being relevant to crop yield especially so in major agricultural species such as wheat barley soybean and maize understanding the molecular and cellular events leading to wall ingrowth deposition holds exciting promise to develop new strategies to improve plant performance a key imperative in addressing global food security. This Research Topic presents a timely and comprehensive treatise on transfer cell biology to help define critical questions for future research and thereby generating a deeper understanding of these fascinating and important cells in plant biology.

**Genomics of Plant-Pathogen Interaction and the Stress Response** Ashutosh Mani, Sandeep Kushwaha, 2023-09-25 Plants are an indispensable part of human and animal lives for nutrition and health. But pests diseases and abiotic stress adversely affect crop yield which ultimately places significant pressure on society to provide food to an increasing population. Moreover it also encourages increased chemical pesticide usage on crops which we see in the biomagnification of toxic and hazardous compounds polluting water bodies soil and the environment. This condition will continue to worsen in the future due to the resistance acquiring ability of pathogens against plant defense and chemical treatments. In addition environmental

disturbances and consumer health issues are being reported more promptly than before due to intensive use of pesticides in food production. Plant diseases affect our daily lives as the use of insecticides and pesticides has become part of our food chain. As a result, precise disease diagnosis and management is crucial in order to avoid huge losses in plant production and related commodities. Accurate detection, precise diagnosis, and proper management can play a significant role in keeping plants free from pathogens. In this book, scientists, researchers, and scholars share their research knowledge, offering a valuable resource for understanding plant diseases, pathogen interaction, and responses to stress through an omics perspective, contributing to further advancements in the field. Diseases in plants may be caused by various factors such as viruses, bacteria, fungi, and abiotic stress. Disease causes low crop yield, production of poor quality fruits and grains, and deficiency of nutrients, which have a direct impact on human and animal health. A genomics-based approach can be applied to disease diagnosis, disease outbreak, evolution of plant and pathogen genome for disease outbreak in relation to climate change, and development of long-term strategies for plant health and defense. This book presents an overview of omics technologies and approaches used to understand the relation between plants and their environment in terms of diseases, responses to abiotic stress, the genomics of plant pathogen interaction, herbicide resistance mechanisms, the epigenetics of plant pathogen interaction, gene regulation during abiotic stress response, the oxidative stress response. **Graduate**
