**Generalized Convexity and Vector Optimization** Shashi K. Mishra, Shouyang Wang, Kin Keung Lai, 2008-12-19 The present lecture note is dedicated to the study of the optimality conditions and the duality results for nonlinear vector optimization problems in finite and infinite dimensions. The problems included are nonlinear vector optimization problems, metric dual problems, continuous time vector optimization problems, relationships between vector optimization and variational inequality problems. Nonlinear vector optimization problems arise in several contexts such as in the building and interpretation of economic models, the study of various technological processes, the development of optimal choices in management science, production processes, transportation problems, and statistical decisions, etc. In preparing this lecture note, a special effort has been made to obtain a self-contained treatment of the subjects, so we hope that this may be a suitable source for a beginner in this fast-growing area of research, a semester graduate course in nonlinear programming, and a good reference book. This book may be useful to theoretical economists, engineers, and applied researchers involved in this area of active research. The lecture note is divided into eight chapters. Chapter 1 briefly deals with the notion of nonlinear programming problems with basic notations and preliminaries. Chapter 2 deals with various concepts of convex sets, convex functions, invex set, invex functions, quasiinvex functions, pseudoinvex functions, type I and generalized type I functions, V-invex functions, and univex functions. *Generalized Convexity, Generalized Monotonicity: Recent Results* Jean-Pierre Crouzeix, Juan Enrique Martinez Legaz, Michel Volle, 2013-12-01 A function is convex if its epigraph is convex. This geometrical structure has very strong implications in terms of continuity and differentiability. Separation theorems lead to optimality conditions and duality for convex problems. A function is quasiconvex if its lower level sets are convex. Here again, the geometrical structure of the level sets implies some continuity and differentiability properties for quasiconvex functions. Optimality conditions and duality can be derived for optimization problems involving such functions as well. Over a period of about fifty years, quasiconvex and other generalized convex functions have been considered in a variety of fields including economics, management science, engineering, probability, and applied sciences in accordance with the need of particular applications. During the last twenty-five years, an increase of research activities in this field has been witnessed. More recently, generalized monotonicity of maps has been studied. It relates to generalized convexity of functions as monotonicity relates to convexity. Generalized monotonicity plays a role in variational inequality problems, complementarity problems, and more generally in equilibrium problems. *Generalized Convexity, Generalized Monotonicity and Applications* Andrew Eberhard, Nicolas Hadjisavvas, D.T. Luc, 2006-06-22 In recent years, there is a growing interest in generalized convex functions and generalized monotone mappings among the researchers of applied mathematics and other sciences. This is due to the fact that mathematical models with these functions are more suitable to describe problems of the real world than models using conventional convex and monotone functions. Generalized convexity and monotonicity are now considered as an independent branch of applied

mathematics with a wide range of applications in mechanics economics engineering finance and many others The present volume contains 20 full length papers which reflect current theoretical studies of generalized convexity and monotonicity and numerous applications in optimization variational inequalities equilibrium problems etc All these papers were refereed and carefully selected from invited talks and contributed talks that were presented at the 7th International Symposium on Generalized Convexity Monotonicity held in Hanoi Vietnam August 27-31 2002 This series of Symposia is organized by the Working Group on Generalized Convexity WGGC every 3 years and aims to promote and disseminate research on the field The WGGC <http://www.genconv.org> consists of more than 300 researchers coming from 36 countries
