Genetic Polymorphism Of Bovine Alpha Lactalbumin Coding Variations In Bovine Breeds:

Genetic Polymorphism of Bovine Alpha-Lactalbumin Syed Tanveer Iqbal, Khalid Majid Fazili, 2012-02 Bovine alpha lactalbumin the regulatory component of lactose synthase complex is an important milk protein The genetic locus of the protein spans over 2.5 kbp s on chromosome 5 and is comprised of four exons encoding 123 residue long monomeric protein The differential expression of this gene in various cattle species has been attributed to its genetic polymorphism explaining the role of allelic variations in milk production Based on these facts we have screened three bovine breeds namely Holstein Jersey and local indigenous breeds for allelic variations where we have seen some novel SNP s which could be responsible for differential milk production in various breed **Cumulated Index Medicus** ,1995 **Bibliography of Agriculture with**

Genetic Evaluation and Modification of Animals Utilizing the 5' Flanking Region of the Bovine α -Lactalbumin Gene Gregory Thomas Bleck, 1993 **The Identification and Characterization of Copy Number Variants in the Bovine Genome** Ryan Doan, 2013 Separate domestication events and strong selective pressures have created diverse phenotypes among existing cattle populations however the genetic determinants underlying most phenotypes are currently unknown *Bos taurus* *Bos taurus* and *Bos taurus indicus* *Bos indicus* cattle are subspecies of domesticated cattle that are characterized by unique morphological and metabolic traits Because of their divergence they are ideal model systems to understand the genetic basis of phenotypic variation Here we developed DNA and structural variant maps of cattle genomes representing the *Bos taurus* and *Bos indicus* breeds Using this data we identified genes under selection and biological processes enriched with functional coding variants between the two subspecies Furthermore we examined genetic variation at functional non coding regions which were identified through epigenetic profiling of indicative histone and DNA methylation modifications Copy

number variants which were frequently not imputed by flanking or tagged SNPs represented the largest source of genetic divergence between the subspecies with almost half of the variants present at coding regions We identified a number of divergent genes and biological processes between *Bos taurus* and *Bos indicus* cattle however the extent of functional coding variation was relatively small compared to that of functional non coding variation Collectively our findings suggest that copy number and functional non coding variants may play an important role in regulating phenotypic variation among cattle breeds and subspecies The electronic version of this dissertation is accessible from <http://hdl.handle.net/1969/1/151022>
