Name: _____

1. Draw the food web based on the following information, and then complete the table with the trophic level(s) occupied by the organism.

2. Consider the trophic transfer efficiency of the Puget Sound orca food chain. Each of the species described below is the dominant species in their trophic level so understanding energy transfers among these four species goes a long way toward understanding energy transfers in the whole ecosystem. Based on the information provided below, your job is to:

- Draw the food chain.
- Create a data table that includes each organism in the food chain, its trophic level, the energy it is able to acquire, its biomass and the number of individuals per square meters.
- Draw the pyramid of numbers
- Draw the pyramid of biomass.
- Draw the pyramid of energy (with a calculation of the percent of energy transferred from each trophic level to the next)

For each pyramid, please:

- Include a title
- Be neat. Drawings should be clear with straight lines (doing your pyramid on graph paper would be a good idea)
- Include the actual numbers (with units) inside or next to the box on the ecological pyramid.
- Write a brief evaluation whether and why the pyramids make sense given the patterns of trophic efficiencies described in your notes.

Data and information

The resident orcas of Southern Puget Sound are the top predators of the Puget Sound food chain. Their preferred food is salmon, whose numbers have been seriously declining over the last decade. The salmon feed mostly on zooplankton, in particular, euphausiid krill, which in turn feed on phytoplankton, the primary producers of the marine ecosystem.

Roughly 1,700,000 kcal/m²/yr of sunlight is used by 809 g/m² of primary producers, roughly 17,597 individuals per square meter. The primary producers are able to convert 8,863 kcal/m²/yr of the solar energy into chemical energy. The 912 primary consumers per square meter (37 g/m² of biomass) are able to utilize 1,478 kcal/m²/yr of that energy. However, only 67 kcal/m²/yr is passed on to the 11 g/m² of secondary consumers. The 0.5 secondary consumers per square meter are eaten by the 0.03 third
