Ecology And Biogeography Of Pinus:

Ecology and Biogeography of Pinus David M. Richardson, 2000-07-31 A comprehensive review essential for all involved in the management of natural and planted pine forests *Ecology and Biogeography of Pinus* David M. Richardson, 1998 *Post-Fire Management and Restoration of Southern European Forests* Francisco Moreira, Margarita Arianoutsou, Piermaria Corona, Jorge De las Heras, 2011-11-02 In spite of all the efforts made in fire prevention and suppression every year about 45 000 forest fires occur in Europe burning ca 0 5 million hectares of forests and other rural lands The management of these burned forests has been given much less attention than fire prevention or fire suppression issues but the post fire management of burned areas raises strong concerns economic and social impacts soil erosion and water quality biodiversity loss forest restoration Although there are a few publications which address post fire management the focus of these has been either on general approaches to restoration or specific topics such as preventing post fire soil erosion This book is about the post fire management of fire prone forest types in southern Europe It provides the first comprehensive overview of the topic ranging from stand level to landscape level management and from emergency actions to long term restoration approaches *Proceedings of the X International Symposium on Biological Control of Weeds* Neal R. Spencer, 2000 **Natural Areas Journal** ,2008 **Ecology of the Podocarpaceae in Tropical Forests** Benjamin L. Turner, Lucas Cernusak, 2011 The emergence of angiosperms in tropical forests at the expense of the gymnosperms their ancestral relatives was one of the most important events in the evolutionary history of terrestrial plants Gymnosperms were nearly eliminated from the tropics after the evolution of angiosperms in the early Cretaceous yet conifers of the Podocarpaceae are among the few gymnosperm families that persist in tropical forests worldwide Podocarps are often considered to be restricted to montane sites in the tropics a feature of their biogeography that is used by paleoecologists to reconstruct past forest communities However podocarps also occur in the lowland tropics where they can be the dominant component of forest canopies Podocarps have proved to be remarkably adaptable in many cases members of the family have a semi aquatic lifestyle exhibit drought tolerance and resprouting and include the only known parasitic gymnosperm Other intriguing aspects of podocarp physiology include the mechanism of water transport in the leaves and the conspicuous root nodules which are not involved in nitrogen fixation but instead house arbuscular mycorrhizal fungi Perhaps most surprising paleobotanical evidence indicates that far from being relict members of tropical forest communities podocarps have been dispersing into the tropics since the late Eocene epoch more than 30 million years ago These and other aspects of the Podocarpaceae explored in this volume have far reaching implications for understanding the ecology and evolution of tropical rain forests *GeoDynamics* Peter Atkinson, Giles M. Foody, Steven E. Darby, Fulong Wu, 2004-12-16 While remote sensing gives a surface depiction of the world its recent convergence with GIS enables richer depictions that can be used to simulate physical processes identify trends and make more accurate predictions GeoDynamics is based on specialized lectures from an

international field of experts addressing remote sensing spatially *Pines and Their Mixed Forest Ecosystems in the Mediterranean Basin* Gidi Ne'eman, Yagil Osem, 2021-10-12 Almost 20 years after the first MEDPINE book Ecology biogeography and management of *Pinus halepensis* and *P. brutia* forest ecosystems in the Mediterranean basin Ne'eman and Trabaud 2000 was published this new book presents up to date and state of the art information covering a wide range of topics concerning Mediterranean pine trees growing in native and planted forests their ecosystems and management This will be an essential source of scientific information for learning exploring planning and managing mediterranean pine and mixed forests We focus on genetics adaptation distribution and evolution ecophysiology and drought resistance pine and mixed forest ecosystems forest dynamics biodiversity and biotic interactions fire ecology ecosystem services and policy afforestation and management all under the effect of global climate change While forests are studied mainly in temperate and tropical zones in the light of current climate change focusing on Mediterranean forests growing in semi humid to semi arid zones is more important than ever This book will include mostly review chapters and two outstanding case studies contributed by leading scientists foresters and managers and will serve as a scientific textbook for students of biology agriculture and forestry researchers of ecology forestry and related fields forest managers policy and decision makers

Ecology and Management of Eastern White Pine in the Lake Abitibi (3E) and Lake Temagami (4E) Ecoregions of Ontario C. Latremouille, 2008 Écoscience, 2007 **Invasive Species and Biodiversity Management** Odd Terje Sandlund, Peter Johan Schei, Åslaug Viken, 1999 The invasive species problem will become increasingly important in the years to come Trade travel and tourism are rapidly globalized and border controls are reduced This affects natural ecosystems in which aggressive invaders may have disastrous effects New diseases affect human animal and crop health The Convention on Biological Diversity presents national authorities with a tall order in coping with this problem For the first time in one volume this book presents both ecological biological and epidemiological aspects of invasive species as well as the problem of disease organisms for agriculture and human health The book constitutes a comprehensive background to the global strategy for managing invasive alien species which now is being developed by SCOPE and UNEP **Proceedings of the Norway/UN Conference on Alien Species** Odd Terje Sandlund, Peter Johan Schei, Åslaug Viken, 1996 **Canadian Journal of Botany**, 2007 **The Proceedings of the Linnean Society of New South Wales** Linnean Society of New South Wales, 2006 **Proceedings of the Linnean Society of New South Wales** Linnean Society of New South Wales, 2005 Studying Tree Responses to Extreme Events Achim Bräuning, Andreas Bolte, Cristina Nabais, Sergio Rossi, Ute Sass-Klaassen, 2017-06-05 Trees are among the longest living organisms They are sensitive to extreme climatic events and document the effects of environmental changes in form of structural modifications of their tissues These modifications represent an integrated signal of complex biological responses enforced by the environment For example temporal change in stem increment integrates multiple information of tree performance and wood anatomical traits may be altered by climatic

extremes or environmental stress Recent developments in preparative tools and computational image analysis enable to quantify changes in wood anatomical features like vessel density or vessel size Thus impacts on their functioning can be related to climatic forcing factors Similarly new developments in monitoring cambial phenology and mechanistic modelling are enlightening the interrelationships between environmental factors wood formation and tree performance and mortality Quantitative wood anatomy is a reliable indicator of drought occurrence during the growing season and therefore has been studied intensively in recent years The variability in wood anatomy not only alters the biological and hydraulic functioning of a tree but may also influence the technological properties of wood with substantial impacts in forestry On a larger scale alterations of sapwood and phloem area and their ratios to other functional traits provide measures to detect changes in a tree's life functions and increasing risk of drought induced mortality with possible impacts on hydrological processes and species composition of plant communities Genetic variability within and across populations is assumed to be crucial for species survival in an unpredictable future world The magnitude of genetic variation and heritability of adaptive traits might define the ability to adapt to climate change Is there a relation between genetic variability and resilience to climate change Is it possible to link genetic expression and climate change to obtain deeper knowledge of functional genetics To derive precise estimates of genetic determinism it is important to define adaptive traits in wood properties and on a whole tree scale Understanding the mechanisms ruling these processes is fundamental to assess the impact of extreme climate events on forest ecosystems and to provide realistic scenarios of tree responses to changing climates Wood is also a major carbon sink with a long term residence impacting the global carbon cycle How well do we understand the link between wood growth dynamics wood carbon allocation and the global carbon cycle Papers contribution to this Research Topic will cover a wide range of ecosystems However special relevance will be given to Mediterranean type areas These involve coastal regions of four continents making Mediterranean type ecosystems extremely interesting for investigating the potential impacts of global change on growth and for studying responses of woody plants under extreme environmental conditions For example the ongoing trend towards warmer temperatures and reduced precipitation can increase the susceptibility to fire and pests The EU funded COST Action STREeSS Studying Tree Responses to extreme Events a SynthesiS addresses such crucial tree biological and forest ecological issues by providing a collection of important methodological and scientific insights about the current state of knowledge and by opinions for future research needs
