Efficient Metamathematics:

Complexity, Logic, and Recursion Theory Andrea Sorbi, 2019-05-07 Integrates two classical approaches to computability Offers detailed coverage of recent research at the interface of logic computability theory and theoretical computer science Presents new never before published results and provides information not easily accessible in the literature

Handbook of Proof Theory S.R. Buss, 1998-07-09 This volume contains articles covering a broad spectrum of proof theory with an emphasis on its mathematical aspects The articles should not only be interesting to specialists of proof theory but should also be accessible to a diverse audience including logicians mathematicians computer scientists and philosophers Many of the central topics of proof theory have been included in a self contained expository of articles covered in great detail and depth The chapters are arranged so that the two introductory articles come first these are then followed by articles from core classical areas of proof theory the handbook concludes with articles that deal with topics closely related to computer science

Dick de Jongh on Intuitionistic and Provability Logics Nick Bezhanishvili, Rosalie Iemhoff, Fan Yang, 2024-07-25 This book is dedicated to Dick de Jongh's contributions to the theory of intuitionistic and provability logics Consisting of 13 chapters written by leading experts this book discusses de Jongh's original contributions and consequent developments that have helped to shape these fields The book begins with an autobiographic note by Dick de Jongh which discusses the main themes of his work and places the other contributions in context The next four chapters explore the De Jongh Sambin fixed point theorem and other contributions to provability and interpretability logics The following four chapters focus on modal intuitionistic and intuitionistic modal logics They discuss independence of formulas unification and de Jongh formulas in intuitionistic and modal logics Then there follow two chapters on the other two areas to which Dick de Jongh made important contributions the theory of well partial orders and formal learning theory The second to last chapter on Origami Geometry can be seen as representing the Master of Logic program of the Institute for Logic Language and Computation ILLC in which de Jongh invested a lot of energy The book ends with a complete bibliography of Dick de Jongh in the last chapter This volume provides a vital overview and continuation of de Jongh's prolific work in the theory of intuitionistic and provability logics

Intelligent Computer Mathematics Christoph Benzmüller, Bruce Miller, 2020-07-17 This book constitutes the refereed proceedings of the 13th International Conference on Intelligent Computer Mathematics CICM 2020 held in Bertinoro Italy in July 2020 The 15 full papers 1 invited paper and 2 abstracts of invited papers presented were carefully reviewed and selected from a total of 35 submissions The papers focus on advances in automated theorem provers and formalization computer algebra systems and their libraries and applications of machine learning among other topics The conference was held virtually due to the COVID 19 pandemic

Feasible Mathematics II Peter Clote, Jeffrey B. Remmel, 2013-03-13 Perspicuity is part of proof If the process by means of which I get a result were not surveyable I might indeed make a note that this number is what comes out but what fact is this supposed to confirm for me I don't know what is

supposed to come out 1 L Wittgenstein A feasible computation uses small resources on an abstract computation device such as a Turing machine or boolean circuit Feasible mathematics concerns the study of feasible computations using combinatorics and logic as well as the study of feasibly presented mathematical structures such as groups algebras and so on This volume contains contributions to feasible mathematics in three areas computational complexity theory proof theory and algebra with substantial overlap between different fields In computational complexity theory the polynomial time hierarchy is characterized without the introduction of runtime bounds by the closure of certain initial functions under safe composition predicative recursion on notation and unbounded minimization S Bellantoni an alternative way of looking at NP problems is introduced which focuses on which parameters of the problem are the cause of its computational complexity and completeness density and separation collapse results are given for a structure theory for parametrized problems R Downey and M Fellows new characterizations of PTIME and LINEAR SPACE are given using predicative recurrence over all finite tiers of certain stratified free algebras D

Mathematical Problems from Applied Logic I Dov M. Gabbay, Michael Zakharyashev, 2006-07-02 Mathematical Problems from Applied Logic I presents chapters from selected world renowned logicians Important topics of logic are discussed from the point of view of their further development in light of requirements arising from their successful application in areas such as Computer Science and AI language An overview of the current state as well as open problems and perspectives are clarified in such fields as non standard inferences in description logics logic of provability logical dynamics and computability theory The book contains interesting contributions concerning the role of logic today including some unexpected aspects of contemporary logic and the application of logic Efficient

Metamathematics Laurina Christina Verbrugge, 1993 **Logical Investigations Into Dynamic Semantics** Willem Groeneveld, 1995 **Automation of Reasoning** J. Siekmann, G. Wrightson, 2012-12-06 Kind of crude but it works boy it works AZan NeweZZ to Herb Simon Christmas 1955 In 1954 a computer program produced what appears to be the first computer generated mathematical proof Written by M Davis at the Institute of Advanced Studies USA it proved a number theoretic theorem in Presburger Arithmetic Christmas 1955 heralded a computer program which generated the first proofs of some propositions of Principia Mathematica developed by A Newell J Shaw and H Simon at RAND Corporation USA In Sweden H Prawitz D Prawitz and N Voghera produced the first general program for the full first order predicate calculus to prove mathematical theorems their computer proofs were obtained around 1957 and 1958 about the same time that H Gelernter finished a computer program to prove simple high school geometry theorems Since the field of computational logic or automated theorem proving is emerging from the ivory tower of academic research into real world applications asserting also a definite place in many university curricula we feel the time has come to examine and evaluate its history The article by Martin Davis in the first of this series of volumes traces the most influential ideas back to the prehistory of early logical thought showing how these ideas influenced the underlying concepts of most early automatic theorem proving programs

Efficiency in a Fully-expansive Theorem Prover Richard J. Boulton, 1994 Abstract The HOL system is a fully expansive theorem prover Proofs generated in the system are composed of applications of the primitive inference rules of the underlying logic This has two main advantages First the soundness of the system depends only on the implementations of the primitive rules Second users can be given the freedom to write their own proof procedures without the risk of making the system unsound A full functional programming language is provided for this purpose The disadvantage with the approach is that performance is compromised This is partly due to the inherent cost of fully expanding a proof but as demonstrated in this thesis much of the observed inefficiency is due to the way the derived proof procedures are written This thesis seeks to identify sources of non inherent inefficiency in the HOL system and proposes some general purpose and some specialised techniques for eliminating it One area that seems to be particularly amenable to optimisation is equational reasoning This is significant because equational reasoning constitutes large portions of many proofs A number of techniques are proposed that transparently optimise equational reasoning Existing programs in the HOL system require little or no modification to work faster The other major contribution of this thesis is a framework in which part of the computation involved in HOL proofs can be postponed This enables users to make better use of their time The technique exploits a form of lazy evaluation The critical feature is the separation of the code that generates the structure of a theorem from the code that justifies it logically Delaying the justification allows some non local optimisations to be performed in equational reasoning None of the techniques sacrifice the security of the fully expansive approach A decision procedure for a subset of the theory of linear arithmetic is used to illustrate many of the techniques Decision procedures for this theory are commonplace in theorem provers due to the importance of arithmetic reasoning The techniques described in the thesis have been implemented and execution times are given The implementation of the arithmetic procedure is a major contribution in itself For the first time users of the HOL system are able to prove many arithmetic lemmas automatically in a practical amount of time typically a second or two The applicability of the techniques to other fully expansive theorem provers and possible extensions of the ideas are considered

Recursion Theory for Metamathematics Raymond M. Smullyan, 1993-01-28 This work is a sequel to the author's *Gödel's Incompleteness Theorems* though it can be read independently by anyone familiar with Gödel's incompleteness theorem for Peano arithmetic The book deals mainly with those aspects of recursion theory that have applications to the metamathematics of incompleteness undecidability and related topics It is both an introduction to the theory and a presentation of new results in

Studies Linguistics grade 1 7 University of Heidelberg language English abstract For centuries language has been shaped by
circumstances not only of great importance but also in accordance with the strength of resonance it has had with men They
encompass social and historical events as well as innovations of thinking which can be understood as a product of persistence
and the will to evolve as intelligent beings Thereby it has generated the coinage of lexical items in particular areas of a
language and furthermore leading to influencing foreign languages through language contact English as the world s most
widely spoken language is a thesaurus of a range of philosophical German etymons as well as borrowings that have made
their way into the English lexicon The Age of Enlightenment as the turning point of the independent use of reason introduced
a scientific revolution in Europe which was to explain the natural world by promoting philosophy The remarkable influence of
philosopher Immanuel Kant 1724 1804 within Idealism in the eighteenth century is noticeable within the set of new meanings
to already existing vocabulary and also sets the terms for much of the nineteenth and twentieth century Others include
Edmund Husserl 1859 1938 the founder of phenomenology and Martin Heidegger 1889 1976 two important German
philosophers of the twentieth century which had a major impact on new lexical items In addition Heidegger as the chief
leader of new compounds introduced a special vocabulary of his own This study examines the German philosophy and its
impact on the English language over the centuries There will be some lexical items which are rather frequently used in an
everyday life context and others which up to this time may appear rather unknown to the English speaker In some cases
there will be a more detailed analysis of the given lexical item owing to the specific usages and also subsequently to their
varying meaning
