Data Mining and Data Visualization , 2005-05-02 Data Mining and Data Visualization focuses on dealing with large scale data a field commonly referred to as data mining The book is divided into three sections The first deals with an introduction to statistical aspects of data mining and machine learning and includes applications to text analysis computer intrusion detection and hiding of information in digital files The second section focuses on a variety of statistical methodologies that have proven to be effective in data mining applications These include clustering classification multivariate density estimation tree based methods pattern recognition outlier detection genetic algorithms and dimensionality reduction The third section focuses on data visualization and covers issues of visualization of high dimensional data novel graphical techniques with a focus on human factors interactive graphics and data visualization using virtual reality This book represents a thorough cross section of internationally renowned thinkers who are inventing methods for dealing with a new data paradigm Distinguished contributors who are international experts in aspects of data mining Includes data mining approaches to non numerical data mining including text data Internet traffic data and geographic data Highly topical

discussions reflecting current thinking on contemporary technical issues e.g streaming data Discusses taxonomy of dataset sizes computational complexity and scalability usually ignored in most discussions Thorough discussion of data visualization issues blending statistical human factors and computational insights [Interactive Visualization of Categorical Data Sets](#) John Beck, 2012 Many people in widely varied fields are exposed to categorical data describing myriad observations The breadth of applications in which categorical data are used means that many of the people tasked to apply these data have not been trained in data analysis Visualization of data is often used to alleviate this problem since visualization can convey relevant information in a non mathematical manner However visualizations are frequently static and the tools to create them are largely geared towards quantitative data It is the purpose of this thesis to demonstrate a method which expands on the parallel coordinates method of visualization and uses a Google Maps style of interaction and view dependent data presentation for visualizing and exploring categorical data that is accessible by non experts and promotes the use of domain specific knowledge The parallel coordinates method has enjoyed increasing popularity in recent times but has several shortcomings This thesis seeks to address some of these problems in a manner which involves not just addressing the final static image which is generated but the paradigm of interaction as well [Graphics of Large Datasets](#) Antony Unwin, Martin Theus, Heike Hofmann, 2007-06-12 Graphics are great for exploring data but how can they be used for looking at the large datasets that are commonplace to day This book shows how to look at ways of visualizing large datasets whether large in numbers of cases or large in numbers of variables or large in both Data visualization is useful for data cleaning exploring data identifying trends and clusters spotting local patterns evaluating modeling output and presenting results It is essential for exploratory data analysis and data mining Data analysts statisticians computer scientists indeed anyone who has to explore a large dataset of their own should benefit from reading this book New approaches to graphics are needed to visualize the information in large datasets and most of the innovations described in this book are developments of standard graphics There are considerable advantages in extending displays which are well known and well tried both in understanding how best to make use of them in your work and in presenting results to others It should also make the book readily accessible for readers who already have a little experience of drawing statistical graphics All ideas are illustrated with displays from analyses of real datasets and the authors emphasize the importance of interpreting displays effectively Graphics should be drawn to convey information and the book includes many insightful examples From the reviews Anyone interested in modern techniques for visualizing data will be well rewarded by reading this book There is a wealth of important plotting types and techniques Paul Murrell for the Journal of Statistical Software December 2006 This fascinating book looks at the question of visualizing large datasets from many different perspectives Different authors are responsible for different chapters and this approach works well in giving the reader alternative viewpoints of the same problem Interestingly the authors have cleverly chosen a definition of large dataset Essentially they focus on datasets with the order of a million cases As the authors point

out there are now many examples of much larger datasets but by limiting to ones that can be loaded in their entirety in standard statistical software they end up with a book that has great utility to the practitioner rather than just the theorist. Another very attractive feature of the book is the many colour plates showing clearly what can now routinely be seen on the computer screen. The interactive nature of data analysis with large datasets is hard to reproduce in a book but the authors make an excellent attempt to do just this. P Marriott for the Short Book Reviews of the ISI

Visualizing Time Graham Wills, 2011-12-02 Art or Science Which of these is the right way to think of the field of visualization? This is not an easy question to answer even for those who have many years experience in making graphical depictions of data with a view to help people understand it and take action. In this book Graham Wills bridges the gap between the art and the science of visually representing data. He does not simply give rules and advice but bases these on general principles and provides a clear path between them. This book is concerned with the graphical representation of time data and is written to cover a range of different users. A visualization expert designing tools for displaying time will find it valuable but so also should a financier assembling a report in a spreadsheet or a medical researcher trying to display gene sequences using a commercial statistical package.
