System Engineering with SysML Birgit Vogel-Heuser, 2025-04-21 Systemic thinking is required to design increasingly complex mechatronic systems SysML is a description language that is tailored precisely to this purpose Based on UML it also enables the modelling of requirements hardware and time behaviour in the context of both simulation and testing A model based engineering decision is expensive and risky so efficient assessment of the suitability of SysML is critical to success as is rapid familiarisation The book and the accompanying digital material with the models in two modelling environments EASystems and CoDeSys enable a step by step efficient introduction that extends to the various facets of more complex mechatronic production systems The book plus material can be used both as a basis for courses including exercises and interactive formats and as a step by step introduction to more realistic models from the perspective of manufacturers of mechatronic systems through to production systems

*A Hetero-functional Graph Theory for Modeling Interdependent Smart City Infrastructure* Wester C. H. Schoonenberg, Inas S. Khayal, Amro M. Farid, 2018-11-30 Cities have always played a prominent role in the prosperity of civilization Indeed every great civilization we can think of is associated with the prominence of one or more thriving cities And so understanding cities their inhabitants their institutions their infrastructure what they are and how they work independently and together is of fundamental importance to our collective growth as a human civilization Furthermore the 21st century smart city as a result global climate change and large scale urbanization will emerge as a societal grand challenge This book focuses on the role of interdependent infrastructure systems in such smart cities especially as it relates to timely and poignant questions about resilience and sustainability In particular the goal of this book is to present in one volume a consistent Hetero Functional Graph Theoretic HFGT treatment of interdependent smart city infrastructures as an overarching application domain of engineering systems This work may be contrasted to the growing

literature on multi layer networks which despite significant theoretical advances in recent years has modeling limitations that prevent their real world application to interdependent smart city infrastructures of arbitrary topology In contrast this book demonstrates that HFGT can be applied extensively to an arbitrary number of arbitrarily connected topologies of interdependent smart city infrastructures It also integrates for the first time all six matrices of HFGT in a single system adjacency matrix The book makes every effort to be accessible to a broad audience of infrastructure system practitioners and researchers e g electric power system planners transportation engineers and hydrologists etc Consequently the book has extensively visualized the graph theoretic concepts for greater intuition and clarity Nevertheless the book does require a common methodological base of its readers and directs itself to the Model Based Systems Engineering MBSE community and the Network Science Community NSC To the MBSE community we hope that HFGT will be accepted as a quantification of many of the structural concepts found in model based systems engineering languages like SysML To the NSC we hope to present a new view as how to construct graphs with fundamentally different meaning and insight Finally it is our hope that HFGT serves to overcome many of the theoretical and modeling limitations that have hindered our ability to systematically understand the structure and function of smart cities
