Perspectives on Environmental Impact Assessment B.D. Clark, A. Gilad, R. Bisset, P. Tomlinson, 2012-12-06. The experience of highly industrialized countries demonstrates that single minded pursuit of economic development is self defeating because by disregarding the other components of what is commonly called the quality of life it creates conditions which are not acceptable to large sectors of the population. In the recent past a number of projects for example major dams have had unexpectedly deleterious social, environmental and health consequences. As a result many government departments and agencies are investigating the impacts of specific projects and are examining the role impact analysis could play in project planning. The process of environmental impact analysis has been developed, tested and institutionalized in several countries. The objective of the process is a prior identification and definition of likely environmental impacts of projects such as public works, industrial developments and tourist developments as well as the impact of policies and legislative proposals. The environmental impact analysis process also includes the definition of alternative courses of action which would achieve comparable economic objectives while eliminating some or all of the detrimental environmental consequences. Identification of preventive or precautionary measures which would minimize the unavoidable impacts form an integral part of the process. The aim should be for a balanced appraisal in which economic, technical, social, environmental and health aspects are fully evaluated. Thus viewed, environmental impact analysis emerges as one of the most powerful planning tools for the prevention of environmental pollution and degradation.
