Effect Sizes for Research Robert J. Grissom, John J. Kim, 2014-04-04 The goal of this book is to inform a broad readership about a variety of measures and estimators of effect sizes for research their proper applications and interpretations and their limitations Its focus is on analyzing post research results. The book provides an evenhanded account of controversial issues in the field such as the role of significance testing Consistent with the trend toward greater use of robust statistical methods the book pays much attention to the statistical assumptions of the methods and to robust measures of effect size Effect Sizes for Research discusses different effect sizes for a variety of kinds of variables designs circumstances and purposes It covers standardized differences between means correlational measures strength of association and confidence intervals The book clearly demonstrates how the choice of an appropriate measure might depend on such factors as whether variables are categorical ordinal or continuous satisfying assumptions the sampling method and the source of variability in the population It emphasizes a practical approach through worked examples using real data formulas and rationales for a variety of variables designs and purposes to help readers apply the material to their own data sets software references for the more tedious calculations and informative figures and tables questions and over 300 references Intended as a resource for professionals researchers and advanced students in a variety of fields this book is an excellent supplement for advanced courses in statistics in disciplines such as psychology education the social sciences business management and medicine A prerequisite of introductory statistics through factorial analysis of variance and chi Effect Sizes for Research Robert J. Rosnow, Donald B. Rubin, 2000 Contrasts are statistical procedures for asking focused questions of data Compared to diffuse or omnibus questions focused questions are characterized by greater conceptual clarity and greater statistical power when examining those focused questions If an effect truly exists we are more likely to discover it and to believe it to be real when asking focused questions rather than omnibus ones Researchers teachers of research methods and graduate students will be familiar with the principles and procedures of contrast analysis but will also be introduced to a series of newly developed concepts measures and indices that permit a wider and more useful application of contrast analysis This volume takes on this new approach by introducing a family of correlational effect size estimates The Essential

Hence mathematical ability is not a prerequisite for this text This text provides a nonmathematical treatment of effect sizes within the context of research designs Finally to aid understanding critical material is repeated throughout this book **Basic Psychological** Measurement, Research Designs, and Statistics Without Math Marty Sapp, 2006 Handbook for Conducting **Research on Human Sexuality** Michael W. sciences Researchers and practitioners interested in understanding the new statistics and future published research will also appreciate this book A basic familiarity with introductory statistics is assumed **How Methodological Features Affect** Effect Sizes in Education Alan Cheung, Robert Slavin, 2016 As evidence based reform becomes increasingly important in educational policy it is becoming essential to understand how research design might contribute to reported effect sizes in experiments evaluating educational programs The purpose of this study was to examine how methodological features such as types of publication sample sizes and research designs affect effect sizes in experiments In order to investigate the relationships between study methodological features and effect sizes the authors analyzed 645 studies that met the standards of inclusion for any of 12 reviews written for the Best Evidence Encyclopedia and in most cases published in review journals The reviews cover programs in elementary and secondary math elementary and secondary science and elementary and secondary reading as well as a review of elementary reading programs for struggling readers and a review of early childhood education Studies included in reviews focusing on technology applications in reading and math were also included Comprehensive Meta Analysis software Version 2 Borenstein Hedges Higgins Rothstein 2005 was used to carry out all statistical analyses such as Q statistics and overall effect sizes The findings suggest that effect sizes are roughly twice as large for published articles small scale trials and experimenter made measures than for unpublished reports large scale studies and independent measures respectively In addition effect sizes are significantly higher in quasi experiments than in randomized experiments Based on the findings of the analyses it is clear that researchers as well as policy makers need to take into account research design sample size measures and type of publication before comparing effect sizes from program evaluations Some specific recommendations are provided **Research Methods in Education and Psychology** Donna M Mertens, 1998 It not only covers two of the standard paradigms postpositivist and interpretive constructivist but discusses a relative newcomerthe emancipatory paradigm that is inclusive of the perspectives of feminists ethnic racial minorities and persons with disabilities In each chapter Donna M Mertens carefully explains a step of the research process from the literature review to types of research method to analysis and reporting of quantitative or qualitative approaches

Longitudinal Stability of Effect Sizes in Educational Research Joshua A. Stephens, Cleveland State University. College of Education and Human Services, 2013 Abstract Effect sizes are the statistic generated by meta analyses a commonly used statistic in education research Meta analyses are widely used by education practitioners administrators and policy makers as a means to decide best classroom or school practices. It has been suggested by authors in other fields most notably Jennions and Moller 2001 that effect sizes have declined over time due to various sources of bias. This paper examines the question of whether shifting effect sizes can be observed in educational research and attempts to explain possible causes of this observation. It uses the methodological framework used by Jennions and Moller 2001 and applies it to educational meta analyses conducted from 1970 to the present. It finds that contrary to the findings of Jennions and Moller 2001 that effect

sizes in educational research have increased over time Likely explanations regard systemic bias in the conduct and publication of educational research. The paper concludes with recommendations for future research to examine causal factors contributing to this phenomenon *Encyclopedia of Human Development: F-O* Neil J. McNeil, Isadore Newman, Francis J. Kelly, 1996 now Because the technique of multiple linear regression has been accepted by the research community since 1975 Keith McNeil Isadore Newman and Francis J Kelly devote little space to defending the equivalence of correlational and ANOVA procedures with multiple linear regression Instead they show how the multiple linear regression technique frees the researcher from wondering if an analysis can be done and refocuses him or her back to the central concern the research question itself The first three sections of chapter 1 provide a conceptual research and statistical orientation to the entire text The remainder of chapter 1 furnishes the rationale for the utility of a conceptual model of behavior along with one such model that can be used to identify predictor variables The authors strongly suggest that readers familiar with the general linear model read these three sections before delving into the more advanced material Readers who are relatively unfamiliar with the general linear model should read the first eight chapters before branching off into topics that are of immediate interest Examples are provided throughout the text all using the same data in the same widely available statistical analysis package Although the technique can be taught with matrix algebra the authors use the simpler approach of vector algebra an approach more in line with the way data are conceptualized and entered into the computer All of the correlational statistical techniques are shown

to be subsets of the general linear model Of more importance however researchers are encouraged to think beyond these limitations and to ask the research questions they are interested in Thus the common researcher is freed from the shackles of the right statistical procedure and its associated right computer analysis
