Exploratory Analysis Of Spatial And Temporal Data A Systematic Approach:

Exploratory Analysis of Spatial and Temporal Data Natalia Andrienko, Gennady Andrienko, 2006-03-28 Exploratory data analysis EDA is about detecting and describing patterns trends and relations in data motivated by certain purposes of investigation As something relevant is detected in data new questions arise causing specific parts to be viewed in more detail So EDA has a significant appeal it involves hypothesis generation rather than mere hypothesis testing The authors describe in detail and systemize approaches techniques and methods for exploring spatial and temporal data in particular They start by developing a general view of data structures and characteristics and then build on top of this a general task typology distinguishing between elementary and synoptic tasks This typology is then applied to the description of existing approaches and technologies resulting not just in recommendations for choosing methods but in a set of generic procedures for data exploration Professionals practicing analysis will profit from tested solutions illustrated in many examples for reuse in the catalogue of techniques presented Students and researchers will appreciate the detailed description and classification of exploration techniques which are not limited to spatial data only In addition the general principles and approaches described will be useful for designers of new methods for EDA

Cartographic Communication Boris Mericskay, 2024-01-31 This book deals with the geological record and the evolution of ideas concerning the Variscan orogenic belt in France and neighboring regions Volume 1 is based on a general introduction concerning the imprint of the Variscan period on the geology of France as well as on the particularities of the study of this ancient orogen A history of the concepts applied to the Variscan belt is proposed in order to consider this orogen in the history of Earth Sciences A paleogeodynamic analysis of the Variscan cycle sets the general framework for the evolution of the orogen which is then tackled through the prism of the magmatic metamorphic and tectonic record of the early phases from Cambrian to Lower Carboniferous Volume 2 proposes an analysis of the late evolution of the Variscan orogenic belt reflecting its dismantling in a high temperature context during the Upper Carboniferous and Permian The sedimentary archives are described as well as the questions raised by the specificities of this ancient orogen

Arthur James Wells, 2006 **Environment & Planning**, 2004 **Canadian Journal of Soil Science**, 2006 A Cellular Automata Approach to Estimate Incident-related Travel Time on Interstate 66 in Near Real Time Zhuojin Wang, 2010

Incidents account for a large portion of all congestion and a need clearly exists for tools to predict and estimate incident effects. This study examined 1) congestion back propagation to estimate the length of the queue and travel time from upstream locations to the incident location and 2) queue dissipation. Shockwave analysis, queuing theory, and cellular automata were initially considered. Literature indicated that shockwave analysis and queuing theory underestimate freeway travel time under some conditions. A cellular automata simulation model for I 66 eastbound between US 29 and I 495 was developed. This model requires inputs of incident location, day, time, and estimates of duration, lane closures, and timing, and driver rerouting by ramp. The model provides estimates of travel times every 0.2 mile upstream of the incident at every minute after the start of the incident and allows for the determination of queue length over time. It was designed to be used from the beginning of the incident and performed well for normal conditions and incidents but additional calibration was required for rerouting behavior. We recommend that the Virginia Department of Transportation 1) further pursue cellular automata approaches for near real time applications along freeways and 2) consider adopting an approach to address detector failures and errors. Adopting these recommendations should improve VDOT's freeway real time travel time estimation and other applications based on detector data.

An Exploratory Data Analysis Approach for Land Use-transportation Interaction, 2003. Land use and transportation interaction is a complex and dynamic process. Many models have been used to study this interaction during the last several decades. Empirical studies suggest that land use and transportation patterns can be highly variable between geographic areas and at different spatial and temporal scales. Identifying these changes presents a major challenge. When we recognize that long term changes could be affected by other factors such as population growth, economic development, and policy decisions, the challenge becomes even more overwhelming. Most existing land use and transportation interaction models are based on some prior theories and use mathematical or simulation approaches to study the problem. However, the literature also suggests that little consensus regarding the conclusions can be drawn from empirical studies that apply to these models. There is a clear research need to develop alternative methods that will allow us to examine the land use and transportation patterns in more flexible ways and to help us identify potential improvements to the existing models. This dissertation presents a spatio-temporal data model that offers exploratory data analysis capabilities to interactively examine the land use and transportation interaction at user specified spatial and temporal scales. The spatio-temporal patterns and the summary statistics derived from this interactive exploratory analysis process can be used to help us evaluate the hypotheses and modify the structures used in the existing models. The results also can suggest additional analyses for a better understanding of land use and transportation interaction. This dissertation first introduces a conceptual

framework for the spatio temporal data model Then based on a systematic method for explorations of various data sets relevant to land use and transportation interaction this dissertation details procedures of designing and implementing the spatio temporal data model Finally the dissertation describes procedures of creating tools for generating the proposed spatio temporal data model from existing snapshot GIS data sets and illustrate its use by means of exploratory data analysis Use of the spatio temporal data model in this dissertation study makes it feasible to analyze spatio temporal interaction patterns in a more effective and efficient way than the conventional snapshot GIS approach Extending Sinton s measurement framework into a spatio temporal conceptual interaction framework on the other hand provides a systematic means of exploring land use and transportation interaction
