Heterogeneous System Architecture Wen-mei W. Hwu, 2015-11-20 Heterogeneous Systems Architecture a new compute platform infrastructure presents a next generation hardware platform and associated software that allows processors of different types to work efficiently and cooperatively in shared memory from a single source program HSA also defines a virtual ISA for parallel routines or kernels which is vendor and ISA independent thus enabling single source programs to execute across any HSA compliant heterogeneous processor from those used in smartphones to supercomputers The book begins with an overview of the evolution of heterogeneous parallel processing associated problems and how they are overcome with HSA Later chapters provide a deeper perspective on topics such as the runtime memory model queuing context switching the architected queuing language simulators and tool chains Finally three real world examples are presented which provide an early demonstration of how HSA can deliver significantly higher performance thru C based applications Contributing authors are HSA Foundation members who are experts from both academia and industry Some of these distinguished authors are listed here in alphabetical order Yeh Ching Chung Benedict R Gaster Juan Gomez Luna Derek Hower Lee Howes Shih Hao Hung Thomas B Jablin David Kaeli Phil Rogers Ben Sander I Jui Ray Sung Provides clear and concise explanations of key HSA concepts and fundamentals by expert HSA Specification contributors Explains how performance bound programming algorithms and application types can be significantly optimized by utilizing HSA hardware and software features Presents HSA simply clearly and concisely without reading the detailed HSA Specification documents Demonstrates ideal mapping of processing resources from CPUs to many other heterogeneous processors that comply with HSA Specifications Heterogeneous Computing Architectures Olivier Terzo, Karim Djemame, Alberto Scionti, Clara

Pezuela, 2019-09-10 Heterogeneous Computing Architectures Challenges and Vision provides an updated vision of the state of the art of heterogeneous computing systems covering all the aspects related to their design from the architecture and programming models to hardware software integration and orchestration to real time and security requirements The transitions from multicore processors GPU computing and Cloud computing are not separate trends but aspects of a single trend mainstream computers from desktop to smartphones are being permanently transformed into heterogeneous supercomputer clusters The reader will get an organic perspective of modern heterogeneous systems and their future evolution **Automatically Migrating Sequential Applications to Heterogeneous System Architecture** 2018

An Open-Source Research Platform for Heterogeneous Systems on Chip Andreas Dominic Kurth, 2022-10-05 Heterogeneous systems on chip HeSoCs combine general purpose feature rich multi core host processors with domain specific programmable many core accelerators PMCs to unite versatility with energy efficiency and peak performance By virtue of their heterogeneity HeSoCs hold the promise of increasing performance and energy efficiency compared to homogeneous multiprocessors because applications can be executed on hardware that is designed for them However this

heterogeneity also increases system complexity substantially This thesis presents the first research platform for HeSoCs where all components from accelerator cores to application programming interface are available under permissive open source licenses We begin by identifying the hardware and software components that are required in HeSoCs and by designing a representative hardware and software architecture We then design implement and evaluate four critical HeSoC components that have not been discussed in research at the level required for an open source implementation First we present a modular topology agnostic high performance on chip communication platform which adheres to a state of the art industry standard protocol We show that the platform can be used to build high bandwidth e g 2.5 GHz and 1024 bit data width end to end communication fabrics with high degrees of concurrency e g up to 256 independent concurrent transactions Second we present a modular and efficient solution for implementing atomic memory operations in highly scalable many core processors which demonstrates near optimal linear throughput scaling for various synthetic and real world workloads and requires only 0.5 kGE per core Third we present a hardware software solution for shared virtual memory that avoids the majority of translation lookaside buffer misses with prefetching supports parallel burst transfers without additional buffers and can be scaled with the workload and number of parallel processors Our work improves accelerator performance for memory intensive kernels by up to 4 Fourth we present a software toolchain for mixed data model heterogeneous compilation and OpenMP offloading Our work enables transparent memory sharing between a 64 bit host processor and a 32 bit accelerator at overheads below 0.7 % compared to 32 bit only execution Finally we combine our contributions to a research platform for state of the art HeSoCs and demonstrate its performance and flexibility

Middleware is the bridge that connects distributed applications across different physical locations with different hardware platforms network technologies operating systems and programming languages This book describes middleware from two different perspectives from the viewpoint of the systems programmer and from the viewpoint of the applications programmer It focuses on the use of open source solutions for creating middleware and the tools for developing distributed applications The design principles presented are universal and apply to all middleware platforms including CORBA and Web Services The authors have created an open source implementation of CORBA called MICO which is freely available on the web MICO is one of the most successful of all open source projects and is widely used by demanding companies and institutions and has also been adopted by many in the Linux community Provides a comprehensive look at the architecture and design of middleware the bridge that connects distributed software applications Includes a complete commercial quality open source middleware system written in C Describes the theory of the middleware standard CORBA as well as how to implement a design using open source techniques

Programming Models' Support for Heterogeneous Architecture Wei Wu, 2017 Accelerator enhanced computing platforms have drawn a lot of attention due to their massive

peak computational capacity Heterogeneous systems equipped with accelerators such as GPUs have become the most prominent components of High Performance Computing HPC systems Even at the node level the significant heterogeneity of CPU and GPU i.e hardware and memory space differences leads to challenges for fully exploiting such complex architectures Extending outside the node scope only escalate such challenges Conventional programming models such as data flow and message passing have been widely adopted in HPC communities When moving towards heterogeneous systems the lack of GPU integration causes such programming models to struggle in handling the heterogeneity of different computing units leading to sub optimal performance and drastic decrease in developer productivity To bridge the gap between underlying heterogeneous architectures and current programming paradigms we propose to extend such programming paradigms with architecture awareness optimization Two programming models are used to demonstrate the impact of heterogeneous architecture awareness The PaRSEC task based runtime an adopter of the data flow model provides opportunities for overlapping communications with computations and minimizing data movements as well as dynamically adapting the work granularity to the capability of the hardware To fulfill the demand of an efficient and portable Message Passing Interface MPI implementation to communicate GPU data a GPU aware design is presented based on the Open MPI infrastructure supporting efficient point to point and collective communications of GPU residential data for both contiguous and non contiguous memory layouts by leveraging GPU network topology and hardware capabilities such as GPUDirect The tight integration of GPU support in a widely used programming environment free the developers from manually move data into out of host memory before after relying on MPI routines for communications allowing them to focus instead on algorithmic optimizations Experimental results have confirmed that supported by such a tight and transparent integration conventional programming models can once again take advantage of the state of the art hardware and exhibit performance at the levels expected by the underlying hardware capabilities
