For decades the Observer pattern has been the go-to event infrastructure, but it is known to be bug-prone. Functional reactive programming (FRP) replaces Observer radically, improving the quality of event-based code. About the Book *Functional Reactive Programming* teaches you how FRP works and how to use it. You'll begin by gaining an understanding of what FRP is and why it's so powerful. Then you'll work through greenfield and legacy code as you learn to apply FRP to practical use cases. You'll find examples in this book from many application domains using both Java and JavaScript. experienced software developers and the creators of the Sodium FRP library for multiple languages *Mastering Functional Reactive Programming* Robert Johnson,2025 Strongly Typed and Efficient Functional Reactive Programming Wolfgang Jeltsch,2011 **Extensible and Robust Functional Reactive Programming** Ivan Perez Dominguez,2018 **Functional Reactive Programming for Real-time Reactive Systems** Zhanyong Wan,2003 Towards Safe and Efficient Functional Reactive Programming Neil Sculthorpe,2011 Functional Reactive Programming FRP is an approach to reactive programming where systems are structured as networks of functions operating on time varying values signals FRP is based on the synchronous data flow paradigm and supports both continuous time and discrete time signals hybrid systems What sets FRP apart from most other reactive languages is its support for systems with highly dynamic structure dynamism and higher order reactive constructs higher order data flow However the price paid for these features has been the loss of the safety and performance guarantees provided by other less expressive reactive languages Statically guaranteeing safety properties of programs is an attractive proposition This is true in particular for typical application domains for reactive programming such as embedded systems To that end many existing reactive languages have type systems or other static checks that guarantee domain specific constraints such as feedback being well formed causality analysis However compared with FRP they are limited in their capacity to support dynamism and higher order data flow On the other hand as established static techniques do not suffice for highly structurally dynamic systems FRP generally enforces few domain specific constraints leaving the FRP programmer to manually check that the constraints are respected Thus there is currently a trade off between static guarantees and dynamism among reactive languages This thesis contributes towards advancing the safety and efficiency of FRP by studying highly structurally dynamic networks of functions operating on mixed yet distinct continuous time and discrete time signals First an ideal denotational semantics is defined for this kind of FRP along with a type system that captures domain specific constraints The correctness and practicality of the language and type system are then demonstrated by proof of concept implementations in Agda and Haskell Finally temporal properties of signals and of functions on signals are expressed using techniques from temporal logic as motivation and justification for a range of optimisations **Trends in Functional Programming** Greg Michaelson,Phil Trinder,Hans-Wolfgang Loidl,2000
